Trexure

A unified treasury API that makes private Stellar payments accounting-ready.

Project Lead: [NAME]

Built on Stellar / Soroban testnet

Next.js 16 · React 19 · Prisma 7 · BullMQ · Groth16 ZK

[FULL-SLIDE IMAGE — see image prompt #2]

Public by default. Useless to finance.

- Crypto rails are public by default
- Every payroll & vendor payment is exposed
- Privacy tools only hide the transaction
- No reconciliation, no receipts for finance

Solution: Decrypt. Reconcile. Receipt.

- Shield: ZK-proof payloads — the ledger sees noise
- Reconcile: worker matches legs by intentId, automatically
- Receipt: Stripe-style JSON + branded PDF for accounting

Demo: one payment's life, live

- Shield — only a badge + proof hash
- Apply view key — payload revealed (key stays server-side)
- Trigger payout — auto-reconciles to SETTLED
- Receipt — export a real, branded PDF
- Bonus: verify the Groth16 proof on-chain, live

How it works: architecture

- web (Next.js): UI, API, webhook ingest
- worker (BullMQ): reconcile legs, generate receipts
- Postgres + Redis: source of truth + queue/idempotency
- Flow: payment → Stellar → signed webhook → reconcile → SETTLED

[Architecture diagram placeholder — web / worker / Postgres / Redis + Stellar testnet + Mock Anchor]

How it works: real crypto, real plumbing

- ZK: Circom + snarkjs Groth16, verified on-chain (Soroban)
- Not mocked — native BLS12-381 pairing in our contract
- AES-256-GCM, argon2id, CSRF, multi-tenant isolation
- 192 passing tests across 58 files

Impact & market

- Buyers: stablecoin payroll & vendor payments (USD→PHP first)
- Why now: category growing fast; tooling stops at 'send'
- Only Trexure: Stellar-native + ZK-private + reconciled

What's next

- Deploy shielded_transfer pool contract (verify already live)
- Richer ZK: note-based balances + nullifiers
- Swap Mock Anchor → live provider (e.g. Xendit)
- Multi-corridor support + admin/ops hardening

Team & thanks
