

Trexure

A unified treasury API that makes private Stellar payments accounting-ready.

-
- by default. Useless to**
- are public by default
 bill & vendor payment is exposed
 only hide the transaction
 ation, no receipts for finance

Solution: Decrypt. Reconcile. Receipt.

- Shield: ZK-proof payloads — the ledger sees noise
- Reconcile: worker matches legs by intentId, automatically
- Receipt: Stripe-style JSON + branded PDF for accounting

Demo: one payment's life, live

RESTRICTED — SHIELDED

Internal Enclave

The company holds its own view key. The key is decrypted and applied server-side — it never leaves the server and is never shown here.

Apply View Key

Auto-Reconciliation

Trigger Payout

How it works: real crypto, real plumbing

- ZK: Circom + snarkjs Groth16, verified on-chain (Soroban)
- Not mocked — native BLS12-381 pairing in our contract
- AES-256-GCM, argon2id, CSRF, multi-tenant isolation
- 192 passing tests across 58 files

How it works: architecture

Impact & market

- Buyers: stablecoin payroll & vendor payments (USD→PHP first)
- Why now: category growing fast; tooling stops at 'send'
- Only Trexure: Stellar-native + ZK-private + reconciled

What's next

- Deploy shielded_transfer pool contract (verify already live)
- Richer ZK: note-based balances + nullifiers
- Swap Mock Anchor → live provider (e.g. Xendit)
- Multi-corridor support + admin/ops hardening

Thank you!
