

Trexure

A private payment walks in. An accounting-ready receipt walks out.

The unified, ZK-private treasury layer for Stellar — the blockchain disappears.

STELLAR-NATIVE

ZK-PRIVATE

LOCALLY RECONCILED

THE PROBLEM

On a public ledger, privacy is all-or-nothing.

EXAMPLE

Acme Corp runs payroll for 40 contractors in Manila — \$2,500 each in USDC on Stellar.

By lunchtime, a competitor scraping the public ledger knows:

- exactly who Acme pays
- how much each person makes
- Acme's total headcount & burn

So Acme hides it — and now its own finance team can't reconcile or report it either.

FULLY PUBLIC

Every payment exposed. A non-starter for real finance, HR, and vendor relations.

FULLY SHIELDED

Opaque even to the payer. No AML/KYC, no bookkeeping, no “hash X -> deposit Y” proof.

Nothing in between reconciles private proof <-> real fiat.

THE SOLUTION

Private on the outside. Fully reconciled on the inside.

Trexure is a treasury API for Stellar: it shields a payment on-chain, lets only the payer decrypt it, auto-reconciles it against the fiat payout, and emits a Stripe-style receipt.

Three things that are hard to copy — together.

01

STELLAR-NATIVE

Real Soroban txs + a hand-written on-chain verifier. Not a DB pretending to be a chain.

02

ZK-PRIVATE

A genuine Groth16 proof, verified on-chain by a BLS12-381 pairing check. Tamper -> false.

03

LOCALLY RECONCILED

On-chain <-> fiat legs auto-matched into one Stripe-style receipt an accountant trusts.

No incumbent does all three. Stripe can't do crypto or privacy. Crypto rails can't do local reconciliation or a receipt your accountant trusts.

NOT A MOCKUP

The hard, easy-to-fake parts are real — today.

REAL

ZK verification

Groth16 proof checked on-chain by a Soroban BLS12-381 pairing. Tampered statement returns false.

REAL

On-chain leg

Payments submit real shielded_transfer testnet txs; the tx hash resolves on stellar.expert.

REAL

Shield · decrypt · reconcile

View-key decryption, intent-based reconciliation, and the Stripe-style receipt all run for real.

MOCK

Fiat anchor

A Mock Anchor fires the SAME HMAC-signed webhook a real provider (e.g. Xendit) would — drop-in swap.

What Trexure unlocks for Stellar.

Unlocks enterprise volume

Makes Stellar viable for corporate payroll, vendor payouts & treasury — volume that routes around public chains today.

Solves privacy vs. compliance

Selective disclosure: private to the public, fully readable to the owner & its regulators. The version enterprises adopt.

Advances Soroban ZK

Ships a reusable, hand-written on-chain Groth16 / BLS12-381 verifier — a reference for the Soroban dev community.

Onboards non-crypto finance

Abstracts the chain into a Stripe-style API + receipt, lowering the #1 barrier keeping mainstream finance off crypto.

Composable anchor primitive

Drop-in for SEP anchors; corridor-agnostic reconciliation — connective tissue between settlement & the fiat network.

Grows real usage

Every settled payment is a real on-chain tx + contract call — durable, non-speculative volume for the network.

Land the crypto-native payer. Expand into treasury.

BEACHHEAD

Companies already paying contractors in USDC on Stellar — remittance & payroll corridors (US->PH, US->LATAM).

API-first: sign up -> own tenant -> shielded payment -> receipt in minutes.

1 • LAND

Self-serve API + dashboard. Developer-led, usage-based. Free tier to first settled payment.

2 • EXPAND

Multi-corridor, batch payroll, QuickBooks / Xero export, compliance read-access seats.

3 • PARTNER

Embed via Stellar SEP anchors (Xendit, MoneyGram Access) & crypto-payroll platforms; SDF grants.

4 • ENTERPRISE

SSO, RBAC, SLAs, dedicated anchor — land treasury & finance orgs.

PRICING STRATEGY

Usage-based, aligned to value settled.

Priced per reconciled payment — we make money only when a payment settles. SaaS tiers layer on team & compliance features.

STARTER

Free

Up to 50 settled payments / mo

Self-serve · 1 tenant · community support

MOST POPULAR

GROWTH

\$0.25 / pmt

+ \$99 / mo base

Multi-corridor · QuickBooks/Xero · API keys
· email support

ENTERPRISE

Custom

Volume + platform fee

SSO/RBAC · dedicated anchor · SLA ·
compliance seats · audit export

Optional: bps take-rate on FX / anchor spread, revenue-shared with the anchor partner.

ROADMAP

From hackathon build to production treasury layer.

NOW · shipped

Real Groth16 proving on-chain · shielded_transfer testnet txs · self-serve signup · reconcile -> receipt -> PDF · staging deploy

0–3 MONTHS

Mainnet-ready · first live SEP anchor (Xendit) · full value-moving privacy pool (notes / nullifiers) · QuickBooks / Xero export

3–6 MONTHS

Multi-corridor & multi-asset · batch payroll · security audit + SDF grant · compliance read-access (auditor seats)

6–12 MONTHS

Enterprise (SSO / RBAC / SLA) · treasury dashboard & forecasting · anchor marketplace · SDK + partner embeds

Private business payments on Stellar — that your accountant, your auditor, and your regulator can all live with.

ZK privacy · automatic on-chain <-> fiat reconciliation · accountant-ready output. No one else delivers all three.
